

The Data Center Industry Represent New Challenges and Work Opportunities for Women

Leticia Correa, Marketing Channel Manager, Vertiv LATAM

Why do STEM careers generate a positive impact and help improve the quality of life in Latin America?

The speed at which technology advances is impressive, as it is to see this transformation applied in our daily lives, improving not only the industry in which we operate, but also other areas of our lives.

Thanks to technology, we advance in health, education, agribusiness development; we communicate faster, we improve our work with the rapid adoption of remote work, and the STEM careers are the great contributors to those advances.

What is the most important lesson you've learned as a woman in the data center industry?

In the years I've been working in this industry, I've learned that we must always be paying attention to our environment, targeting opportunities and our development, always seeking to adapt to changes and to be close to great professionals, and those points still help me today.

Even if this industry is mostly a male industry, we must learn to be equals showing that competence and professionalism is independent of gender.

What message would you give to a woman to encourage her to choose a career focused on the data center industry?

Although the data center industry is predominantly a male space, we've learned that in daily life there is room for women's growth and development. It is important to be aware of opportunities and conquer your space, never dismissing the skill women have of facing adversity without ever changing our essence.

Making room for women in this industry is part of our present, and what we seek today will help future generations to have their space.
